

# FACT SHEET

## TSX-V: CMB

### CAPITAL STRUCTURE AND KEY DATA

Corporate Head Office: Vancouver, B.C.

Field Office: Whitehorse, Yukon

Operations Office: Mazatlan, Mexico

Major Shareholder: Michael Scholz

52-week high/low: \$0.105/\$0.04

Issued Shares (Feb 18, 2020): 49,138,265

Fully Diluted (Feb 18, 2020): 57,538,265

Insider Share Holdings: 41.8%

Recent Price (Feb. 18, 2020): \$0.045

Market Cap (Feb 18, 2020): \$2,211,221

### OVERVIEW

CMC is focused on exploration and near-term development of high grade precious and base metal projects.

#### Silver Hart

CMC's flagship property is the Silver Hart property (116 claims, 2,017 hectares) located in south central Yukon. It comprises of a high grade classic meta-sediment hosted silver-lead-zinc veins identified in 6 zones to date and mineralization traced for over 1.2 kilometers. Underground development comprises of 673 meters of adit with two raises, and over 170 drill holes to date. Polymetallic veins contain galena, tetrahedrite and sphalerite. The deposit type is considered comparable to significant silver deposits in Mexico and Idaho. Two new zones have been identified in recent exploration and the anomalous areas are significant in size. In 2010, Dahrouge Geological Consulting estimated an NI 43-101 inferred resource of 69,500 tons grading 555.66 g/t silver, 1.89% lead and 9.12% zinc (using a 600 g/t silver cutoff with 1,240,00 contained ounces of silver). Recent work has identified that more mineralization may be distributed through both the footwall and hanging wall which could significantly add to known tonnages and mineable grades may exist in waste material from the adits. CMC is planning the removal and marketing of up to a 10,000 ton bulk sample in 2020, further exploration of new potential zones identified, and preparation for development of a seasonal mine operation in 2021.

#### Logjam

CMC also owns the Logjam property (32 claims, 662 hectares), also located in south-central Yukon comprising of a high-grade polymetallic deposit in no less than 10 veins containing gold, silver, lead, zinc, and to a lesser extent bismuth, antimony and tungsten. Recent sampling provided a best grab sample of 7.5 g/t and 3.7 g/t gold with silver values over 1,000 g/t and over 10% zinc from the #5 and #6 veins. The property also has a 1979 historical non 43-101 compliant probable reserve of 70,144 tons grading 3.02 g/t gold and 392.2 g/t silver. The property has two adits with 701 meters of underground development and 2,971 meters of drilling. In 2020 CMC will rehabilitate the access road, conduct an evaluation of the 5,150 level portal to plan for underground drilling in 2021 and beyond, conduct more detailed prospecting and geological mapping of the property, rehabilitate the camp and conduct progressive reclamation activities.

#### Bishop Mill

CMC owns a 100 ton per day flotation mill with a waste management facility with a capacity of 32,000 tons in Bishop, CA. CMC is currently seeking toll mill processing and/or joint venture opportunities to re-establish mill operations. It is also conducting geological investigations of deposits in the immediate area

and discussing process options with property owners in the region to identify potential ore sources for the mill.
